

Rock Cycle

Add more information to these sentences to make them more informative. Include information such as, where, when, what and descriptive words.

1. The Earth's rocks are changed.

Over millions of years, the Earth's rocks are constantly changed

2. Magma rises to the surface and becomes igneous rocks.

Magma from deep within the Earth rises to the surface, and cools to become igneous rocks.

3. These igneous rocks form sediments, which form sedimentary rocks.

These igneous rocks are weathered and eroded to form sediments, which form sedimentary rocks.

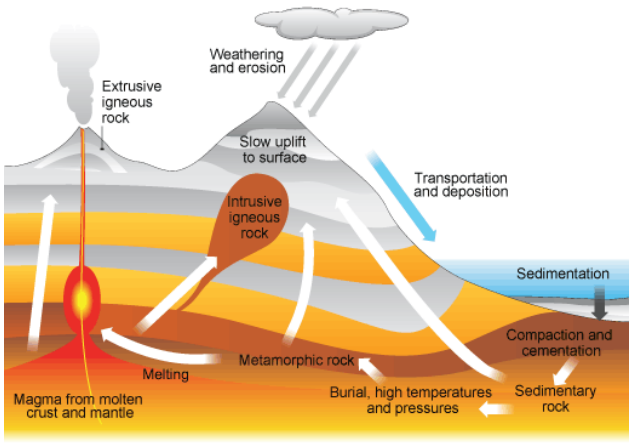

4. As layers build up the bottom layers sink into the Earth's crust.

As layers of sedimentary rocks build up, the bottom layers sink deeper and deeper into the Earth's crust, where the temperature and pressure are greater.

When this happens they can be changed into metamorphic rocks.

5. They may melt to produce magma.

If the temperature is high enough, they may melt to produce magma again.

6. They may be uplifted by forces pushing the rocks upwards.

They may also be uplifted by huge forces pushing the rocks upwards to form mountains.

7. The Earth is being worn down and uplifted by mountain-building forces.

The Earth's surface is constantly being worn down and uplifted by mountain-building forces.

As this happens the rocks are changed from one form to another.

The whole process is called the *rock cycle*.
