ELEMENTS MATCH-UP LITERACY EXERCISE

1

Read through each of the short statements and place those that go together in a group. (For example, those statements that are about elements symbols or metals and non-metals, etc.)

2

Now place them in a logical order so that the information makes sense.

3

Re-write them, changing words where necessary or including punctuation, by joining the statements together in short paragraphs.

another way we can classify elements is into solids, liquids and gases	we classify atoms according to the number of protons they have	mercury is an example of an element that is a liquid
all atoms of a particular element have the same number of protons	any atom that has only one proton is a hydrogen atom	the second letter of an element symbol is never a capital
elements can be classified in two different ways	copper is an example of an element that is a metal	elements are represented by symbols of one or two letters
helium is an example of an element that is a gas	an example is that all oxygen atoms have eight electrons	sodium is an example of an element that is a solid
one way we can classify elements is into metals and non-metals	sulphur is an example of an element that is a non-metal	the first letter of an element symbol is always a capital
