Cells to Tissues

Cells are the _____ blocks of all living things.

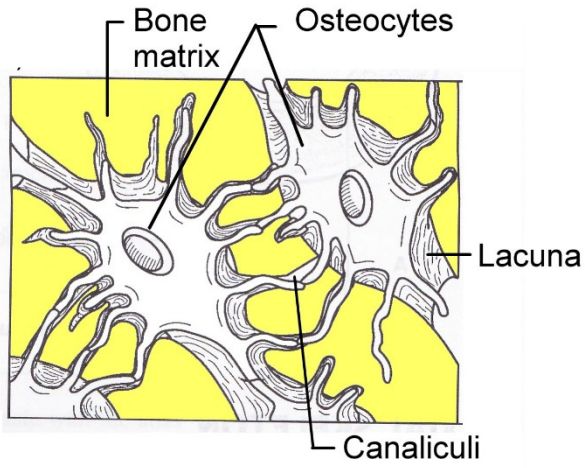

Tissue=a group of cells working together to perform a particular function.

There are 4 main types of tissue

Tissue type	Description	Example	
Connective	The living cells are imbedded in a framework called a _____	Bone Cartilage blood	 Hard matrix Bone cell
Nervous	Caries _____ round the body. Carries nerve impulses.	Sensory neurons Motor neurons	
Epithelial	Lines organs and glands	Skin And lining Of organs	
Muscle	Can contract. This means it can get _____. It helps us _____ things.	Skeletal muscle. This is the muscle that is attached to the _____. When it contracts it allows us to move our _____. Cardiac muscle when it contracts it makes the _____ beat. Smooth muscle when it contracts it helps move through the digestive system.	

Example	Classify as one of the 4 tissue types. _____, _____, _____, or _____
The lining of the stomach	
The biceps in the arms	
The tissue that contracts to make the heart beat	
The skull	
The cells that make up the brain	

In connective tissue the living cells are imbedded in _____. The matrix is like a frame work. In bones the matrix is made of a hard material called Calcium Phosphate. Bone cells are called osteocytes.

Bone matrix
Osteocytes
Lacuna
Canaliculi
