Nucleus	Golgi Apparatus	Mitochondria
Endoplasmic Reticulum	Lysosome	Ribosomes
Cell Membrane	Cell Wall	Cytoplasm
Provides energy for the cell	Packages proteins for transport outside the cell	Control centre of cell, regulates cell activities
Membranes in the cell used for reactions and transport	Organelles used for making proteins	Liquid part of the cell in which the organelles can move around
Destroys foreign or damaged parts of the cell	Rigid wall that gives plant cells structure	Semi permeable membrane that allows materials in and out of the cell.
Diffusion	Movement of materials from high concentration to low concentration	Osmosis
Movement of water across a membrane	Cellular Respiration	Animal cells gaining energy by turning oxygen and glucose to carbon dioxide and water.
