Chapter 8 Rocks

EXTRA WORKSHEET 3: The rock cycle

SCIENCE UNDERSTANDING **LOGICAL/MATHEMATICAL**

Answers

1 Igneous rocks form by cooling of magma.

2 An igneous rock can become heated again if it contacts magma. The heat melts the rock and then this molten rock can reform into an igneous rock when it cools.

3 Weathering/erosion, compression (compaction) and cementing turn an igneous rock into a sedimentary rock.

4 Heat and pressure turn it into a metamorphic rock.

5 Weathering and erosion (followed by compression and cementing) change metamorphic rocks into sedimentary rocks.

6 Heat and pressure turn sedimentary rocks into metamorphic rocks.

7 If a sedimentary rock meets magma, either by sinking into the crust or meeting magma (and hydrothermal fluids) that is rising into the crust, it can turn into an igneous rock.

8 It summarises the changes that occur to rocks to change them from one type into another. This helps us understand how rocks form and how the crust changes.
