Forms of Energy

Complete the descriptions of nine forms of energy below, using one box from each column.

Column A	Column B	Column C
Kinetic	stored energy. It is possessed by things when they are compressed, twisted, flexed or wound up in some way. Objects which have EPE include	fall to the bottom of the cliff. So has a pencil which is standing on its end and water at the top of a waterfall.
Gravitational potential energy	matter by compression waves. Sound energy will not travel through a vacuum because there is no matter in a vacuum	matter by conduction, through liquids and gases through convection and through gases and a vacuum by radiation.
Chemical potential energy is another form	particles. The most useful form of this energy is electrical current, which is	it for photosynthesis, and with laser light we can cut through thick steel, do delicate eye operations or bounce messages off the moon.
Elastic potential energy is another form of	or fused together. If this energy is controlled it can be used to produce large amounts of electrical or heat energy, but	from fuels when they are burnt. All substances have this form of energy.
Electrical energy is energy due to charged	of the particles of matter. The faster the particles are moving, the more energy the matter has. Heat energy travels through solid	so has a falling leaf, a swimming fish and a running person.
Sound energy is energy which travels through	is a form of stored energy. A rock on a cliff face has GPE because it can	clock springs, stretched rubber bands, bent rulers and a bow ready to fire an arrow.
Heat energy is a special form of kinetic energy. Heat energy is energy which matter possesses because of the movement	energy is energy possessed by moving objects. A moving train has kinetic energy,	to carry the waves. Any vibrating object, such as a violin string, or a drum skin, will produce this energy.
Light energy is a form of electromagnetic energy. It is perhaps our most	of stored energy. It is energy stored in the chemical bonds of all substances. It is released	a flow of electrons from one place to another. Appliances like toasters, radios, ovens and motors use this form of energy.
Nuclear energy is the energy released when the structure of atoms is changed by being split	useful form of energy. We need it to see, plants need	uncontrolled it can be disastrous.
