1. A car was involved in a time trial. The car started from rest and accelerated as quickly as possible over the straight course of 700m. It took 35 seconds to complete this distance. Determine the average speed of the car during the time trial. (2)

2. A parachutist is falling with a constant speed of 9 m/s. Calculate how long it will take to reach the ground 2100m below. (3)

3. A toy truck is stationary, then rolls down a ramp with a constant acceleration of 0.3 m/s^2. Calculate its speed after 20 seconds. (3)

4. A force of 5000 N is used to accelerate a car of mass 500 kg along a smooth, flat road. Determine the acceleration of the car. (3)
