1 - ANIMAL HABITATS

Here we have drawn three entirely different habitats.
Make a list of the <u>living things</u>
that you can find in each <u>habitat</u>.

1 - Rainforest

1 - ANIMAL HABITATS

How well can your think?
We have listed 15 different <u>habitats</u>
and beside each, three <u>animals</u>.
<u>Cross out</u> the animal that does not belong.
If you are not sure of an animal, try looking it up in an encyclopaedia.

1 Swimming in a pond	Duck	Wombat	Frog
2 In a farm paddock	Crocodile	Horse	Rabbit
3 Hiding in the garden	Snail	Crab	Earthworm
4 Grazing in grassland areas	Zebra	Elephant	Porpoise
5 Surviving in the desert	Penguin	Scorpion	Camel
6 Happy around the house	Cat	Leopard	Dog
7 Putting up with Arctic winters	Lion	Seal	Polar bear
8 At home in the ocean	Whale	Dolphin	Echidna
9 Soaring through the air	Lark	Owl	Hawk
10 Hiding in a cave	Octopus	Bat	Glow-worm
11 Perched in a tree	Kookaburra	Emu	Galah
12 Roaming in an African game park	Deer	Elephant	Platypus
13 On show in an aquarium	Stingray	Shark	Possum
14 Inhabiting a cold mountain area	Ostrich	Yak	Wolf
15 Living in a river	Salmon	Fox	Trout

1 - ANIMAL HABITATS

E - Food chains

In Unit A of this chapter we learned some facts about habitats.

We learned that a habitat

- was the place or home where an animal spent most of its time,
- was often the home for more than one kind of animal,
- supplied the needs of the animals necessary for their survival,
- might only be visited occasionally by some animals.

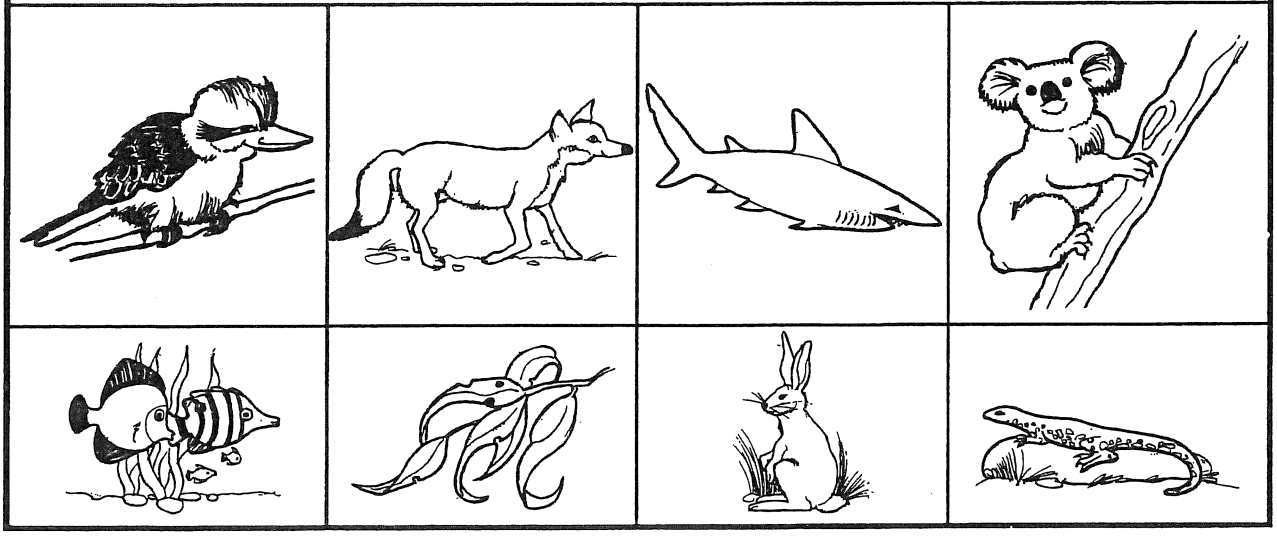

In this Unit we will find out a little more about why animals choose to live where they do.

Food and shelter

The two most important reasons for any animal to live in any place (habitat) are **food and shelter.**

All animals must **eat to survive**, and a reliable **food supply** is the most important reason for any animal to live where it does. It would be silly for a mouse to try to live on a rock on the edge of the ocean or for an oyster to attach itself to a rock in the middle of a wheat field. But to swap them around would make perfect sense. In most cases animals like to live where their food supply is and in most cases that is where they were born. Small animals in particular are like this, because they cannot travel very far.

Here we have drawn four habitats and four animals.
Draw an <u>arrow</u> from the <u>animal</u> to the habitat containing its <u>correct food supply</u>

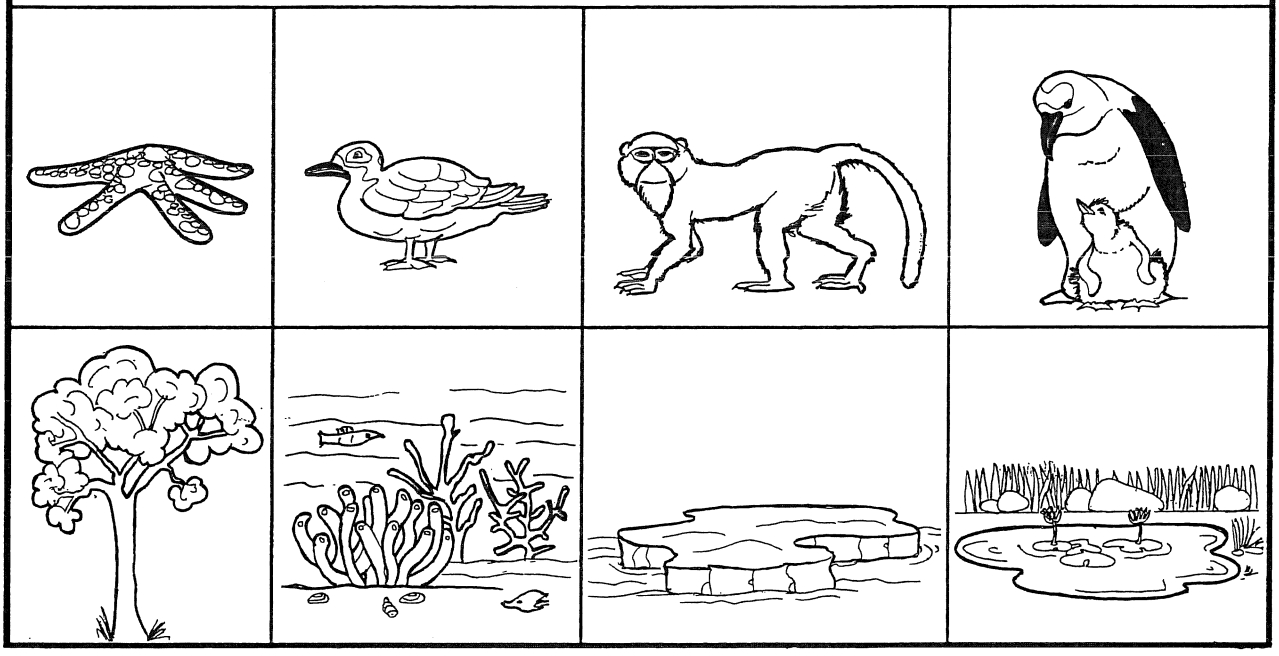

1 - ANIMAL HABITATS

For other animals, **shelter** can be the most important thing to be considered when choosing a habitat. A slug, for example, must find a safe, moist spot to hide in or under, before the sun gets up and burns it to death. To the slug the most important reason in choosing its habitat is shelter - it is unlucky because then it has to find what food it can near its home place. Other animals like birds, lizards, grasshoppers and butterflies have a great variety of places that they can choose from, for their home habitats. Some animals like tigers or elephants have home territories or habitats measuring more than a hundred square kilometres.

Many animals are able to store up food in their bodies as fat. They do this in the summer, when food is plentiful, then sleep (**hibernate**), when food is scarce in winter. Bears and snakes are like this. When an animal hibernates, its need for food is replaced by the greater need, for shelter. Then it has to find a warm secure place like a cave or hole in which to hibernate.

Here we have drawn four habitats and four animals.
Draw an <u>arrow</u> from the <u>animal</u> to the <u>habitat</u> that you would expect to find it in.

Trees and grasses

Trees, grasses and other plants are living things too, just as animals are. They cannot move very much at all, except by growing or having their seeds carried away by the wind or running water, or stuck to the coat of some animal.

1 - ANIMAL HABITATS

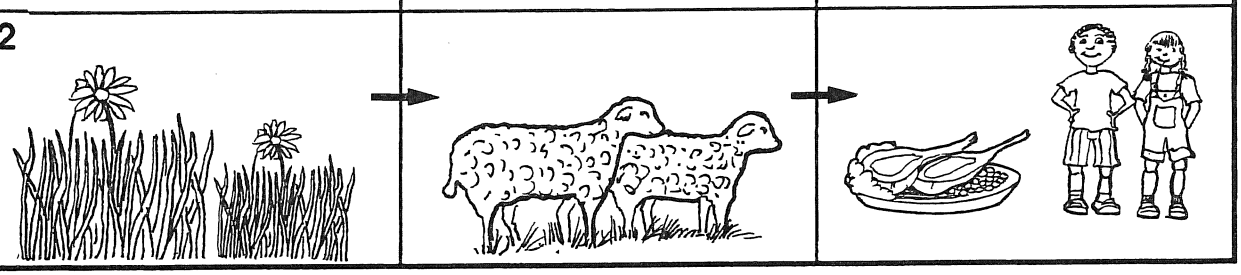

Green plants form very important parts of a habitat. They are able to make their own food supply using the energy of the Sun, and minerals and water that they find in the soil. Many animals depend upon the green plants for their food supply - from the lowly grasshopper to the powerful elephant. Other animals depend on the plant-eaters for their food supply - so lions and other hunting animals feed off animals like deer and antelope that eat grass. If there was no grass there would be no deer and if there were no deer there would be no lions. The way that animals depend upon other living things in their habitat, is called a **food chain**.

Here are <u>two</u> simple food chains.

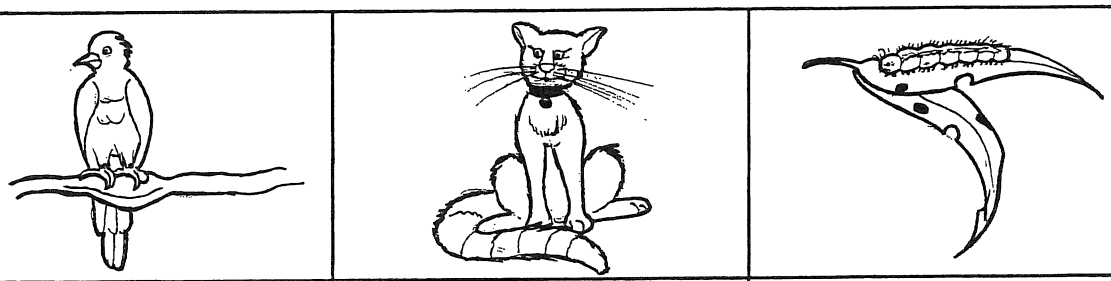

1

2

<u>Copy</u> the drawings from the Top Row of this Table in order to make a <u>correct food chain</u> in the blank row.

1 - ANIMAL HABITATS

How much have you learned ?
Put a <u>circle</u> around the <u>letter</u> that begins the <u>correct answer</u>.

1 An animal's habitat is important because
(a) it stops the animal getting wet.
(b) it provides food and shelter.
(c) it stops the animal getting hungry.
(d) it stops the animal getting cold.

2 You would probably find a mouse
(a) living in a pond.
(b) hunting on a beach.
(c) eating in a wheat field.
(d) sleeping in the snow.

3 You would probably find an oyster
(a) in a desert.
(b) on a tree.
(c) in a swimming pool.
(d) on a rock in the water.

4 To hibernate means
(a) to feed during the night.
(b) to sleep during winter.
(c) to hunt in the daytime.
(d) to die underground.

5 Animals that hibernate are
(a) slugs and snails.
(b) lions and tigers.
(c) fish.
(d) bears and snakes.

6 An animal that depends on plants for its food supply is
(a) the lion.
(b) the elephant.
(c) the whale.
(d) the tiger.

7 Deer provide food for
(a) antelopes.
(b) leopards.
(c) monkeys.
(d) the hippopotamus.

8 The way animals depend on other livings things for food
(a) is called sheltering.
(b) is called a habitat.
(c) is called a food chain.
(d) is called hibernation.
