Following the sun

Plants are sensitive to light and actively seek it out. An experiment can be set up to prove that plants grow towards the light. Three pot plants can be placed in different positions, as shown below.

☞ **1** Draw how the plants would have grown after one week.

2 Rosa thinks that plants won't grow as tall if they grow in the dark, because they won't have enough light to grow quickly. How could she test this? Number the steps below into the correct order to design an experiment.

___ Record the results.

___ Put the rest of the seedlings in a dark cupboard.

___ Collect some seedlings.

___ Put two seedlings on the bench.

___ Water all the seedlings as needed.

___ Measure all the seedlings after one week.

3 Match the phrases below.

Shoots grow upwards	that is needed for photosynthesis.
Shoots grow towards light	water that is needed for plant growth.
Roots grow towards	to get more light and gases.
