Achieve!

Rusting

- Chemical reaction between iron and oxygen
- Produces a new substance – iron oxide
- Rusting occurs when iron or steel is left in damp conditions
- Paint protects the iron from water and oxygen
- Salt speeds up rusting
- Rust = reddish brown flakes
- Things become weak and break more easily

☞ **1** Use the notes above to write a paragraph about rusting.

2 What are the reactants in this chemical reaction?

_____ and _____

3 What is the product? _____

4 Write the word equation for rusting.

5 What is the problem with objects that have rusted?

6 What is one way that we can prevent rusting?

7 Why do objects near the sea rust more quickly?
