Filtration

Filtration is used to separate a mixture of an insoluble solid and a liquid. The mixture is poured through filter paper. Only the liquid passes through – this is called the **filtrate**. The solid that is collected on the filter paper is called the **residue**.

☞ **1** Read the passage above, then use the words in the word bank to label the scientific drawing of filtration.

Word bank
mixture
filter funnel
residue
beaker
filter paper
conical flask
filtrate

2 Decide whether each of the following statements is true or false.

a Salt and water can be separated using filtration. _____

b The liquid that has been filtered is called the filtrate. _____

c Soluble solids can be separated from liquids using filtration. _____

d The solids that are collected in the filter are called the residue. _____

e Both the liquid and insoluble solid pass through into the filtrate. _____

3 Circle the substances that can be separated from water using filtration.

salt jelly crystals pepper

sugar baking soda cordial

soil

instant coffee tea leaves
