Spray-on skin

Spray-on skin is an invention used to help patients regrow new skin after suffering severe burns. It was developed in Australia by Professor Fiona Wood, a plastic surgeon, and Marie Stoner, a scientist. To make spray-on skin, skin cells are taken from the patient. They are mixed with liquid food and grown for five days, then sprayed onto the burn using a special cell sprayer. New skin grows very quickly. Spray-on skin was used to treat victims of the 2002 Bali bombings.

☞ **1** Use the labels in the word bank to complete the flowchart.

Word bank

mixture sprayed on burn

skin cells grown in culture

skin taken from unburnt area

new areas of skin grow on burn

skin cells in sprayer

2 Describe how this invention helps burns victims. _____

_____
