Student sheet

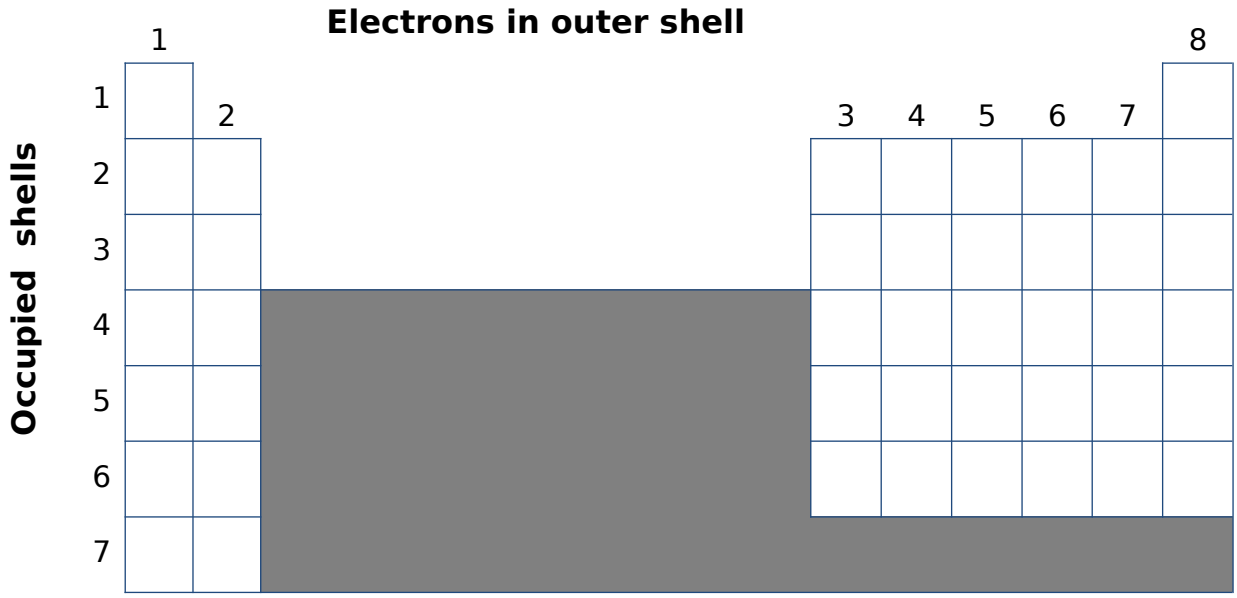

1 x Cruiser – 4 squares

2 x Destroyers – 3 squares

2 x Frigates – 2 squares

1. Mark your ships on the top grid (each ship should have a rectangular shape).
2. Take it in turns to call a shot – do this by reading out the coordinates and the name of the element in that square on the periodic table.
3. Mark the shots you have fired on the bottom grid. Show hits by writing the symbol of the element in the square.

1 x Cruiser – 4 squares

2 x Destroyers – 3 squares

2 x Frigates – 2 squares

Teaching notes

This activity works just like the traditional game of battleships. It is played in pairs and they need a copy of the periodic table.

Each student needs a grid to mark their own battleships on and one to mark their turns on. They then add battleships to their grids (they should all be simple rectangles and can be placed horizontally or vertically on the grid).

They could add the symbols for the elements to each square that their battleships cover.

They should take it in turns to choose a square by reading out the coordinates and **name** of the element occupying that square in the periodic table. If they get a hit they get another go. When one of their battleships has been hit the student should tell their opponent what type of vessel they have hit.

The first person to sink their opponents' battleships wins, (or set a time limit and the winner is the person with the most 'hits').
