h_m_ _st_s_s	START: What is the general word for a chemical messenger?	**h_rm_n_**	In what glands are these chemicals produced?
_nd_cr_n_ gl_nd_	What do hormones travel in?	**bl_ _ d**	Name the sugar that starch is broken down into after a meal.
gl_c_s_	What organ releases a hormone when the concentration of this sugar gets too high?	**p_ncr_ _s**	What hormone does this organ release when the concentration of glucose is too high?
_ns_l_n	Which organ responds to a rise in this hormone by removing glucose from the blood?	**l_v_r**	What is the glucose converted into in this organ?
glyc_g_n	What will happen to the level of glucose in the blood when this hormone is released?	**d_cr_ _s_**	What hormone is released due to this change in glucose levels?
gl_c_g_n	What happens to levels of blood glucose when this hormone is released?	**_ncr_ _s_s**	Name the disease in which the body cannot control blood glucose levels correctly
d_ _b_t_s	How many types of this disease are there?	**_ _ o**	In which type of diabetes can no insulin be made at all?
typ_ 1	In which type of diabetes do a person's cells respond less well to insulin?	**typ_ 2**	Which hormone must people with Type 1 diabetes and in what form?

_ns_l_n _nj_ct__n	Other than insulin, what else reduces blood glucose levels?	**_x_rc_s_**	What (other than glucagon) increases blood glucose levels?
f_ _ d	State a risk factor for type 2 diabetes	**l_ck _f _x_rc_s_**	Obesity is another risk factor for type 2 diabetes. What does it mean?
v_r_ _v_rw_ _ght	A high BMI suggests that someone is too heavy for their height. What does BMI stand for?	**b_dy m_ss _nd_x**	What two things can be adapted to help control Type 2 diabetes?
d_ _t and _x_rc_s_	What is gl_c_s_ used for in the body?	**r_sp_r_t_ _n**	What types of food are most likely to cause a spike in glucose levels?
s_g_ry	What are insulin and glucagon examples of?	**h_rm_ne_s that control the level of gl_c_s_ in the bl_ _d**	Describe how insulin and glucagon affect glucose levels
_nsul_n _____ glucose levels, gl_c_g_n _____ glucose levels	What is the name for a control mechanism that reacts to changing conditions to bring levels back to ideal?	**n_g_t_v_ f_ _db_ck**	Name something else that is regulated by negative feedback
t_mp_r_t_r_	Describe one way in which the body could increase its temperature	**sh_v_r_ng**	Describe one way in which the body could decrease its temperature
sw_ _t_ng	Name three factors that the body must try to maintain constant	**bl_ _d gl_c_s_, t_mp_r_t_r_, w_t_r c_nt_nt**	State the term that means keeping the body's internal environment constant

Teaching notes

This is a domino style activity about the control of blood glucose. There are 32 cards, allowing it to be used with a whole class. The activity could also be done individually, in pairs or in small groups to produce a complete ordered set of cards.

Students may be asked to start by working out the ‘answer’ (left side) on their card as all vowels are missing – this might be useful as a quick settling activity. The domino activity can then begin.

To allow for differentiation, a few of the harder cards have been shaded red/pink, whereas some of the simpler ones are shaded green.

When attempting this activity, students should have already studied homeostasis (especially blood glucose control and including diabetes and its types, risk factors and treatment). The last four cards focus on general aspects of homeostasis and could be missed out if other aspects of homeostasis have not been covered.
