Task

1) Cut out the boxes in the first table. Arrange them according to the part of the ear they are found - the outer, middle or inner ear.
2) Put them in the order that sound signals travel through the ear.
3) Shade in the two parts of the inner ear which are not directly involved in the transmission of sound signals.
4) Cut out the boxes in the second table. Match each function to the correct part of the ear.

Table 1

outer ear	**middle ear**	**inner ear**
oval window	ear drum	hammer (malleus)
cochlea	Eustachian tube	ear canal
stirrup (stapes)	auditory nerve	ear flap (pinna)
semi-circular canals	anvil (incus)	

Table 2

turns sound into electrical messages	**amplifies sound**	**catches and channels sound**
to channel sound	changes sound of different frequencies to electrical signals	vibrates to transmit sound to the inner ear
to catch sound energy	vibrates to transmit sound to the middle ear	links to the throat to adjust air pressure
the body's balance organ	sends electrical signals to the brain	the first bone that amplifies vibrations
the third bone that amplifies vibrations	the second bone that amplifies vibrations	

Answers

outer ear	**catches and channels sound**
ear flap (pinna)	to catch sound energy
ear canal	to channel sound
ear drum	vibrates to transmit sound to the middle ear
middle ear	**amplifies sound**
hammer	the first bone that amplifies vibrations
anvil	the second bone that amplifies vibrations
stirrup	the third bone that amplifies vibrations
oval window	vibrates to transmit sound to the inner ear
inner ear	**turns sound into electrical messages**
cochlea	changes sound of different frequencies to electrical signals
auditory nerve	sends electrical signals to the brain
Eustachian tube	links to the throat to adjust air pressure
semi-circular canals	the body's balance organ
