Introduction

A simple game designed to increase students' confidence in the symbols of circuitry. Most students have played 'pairs' at some time or other, so the rules are generally known to all.

Instructions

Divide the class into groups of between two and four players. Photocopy one set of the sheets (as well as a sheet of answers) for each group. It is best to photocopy them onto card or stiff paper that is thick enough so the typing cannot be seen through it!

Cut the sheets into individual cards. Remove any pairings not relevant to your group.

The aim of the game is to make pairs. A pair consists of **symbol or graph** with its **appropriate name**. The answer sheet is given to each group to help them check the pairings are correct.

Rules of the game

The cards are shuffled and spread out randomly face down on the bench.

The first player turns over two cards. If they are a pair, the player removes them and has another go. If they are not a pair they are turned face down again. When the first player has finished their go, play moves to the next player.

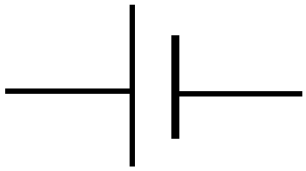

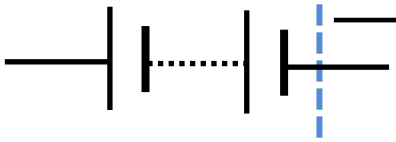

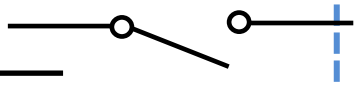

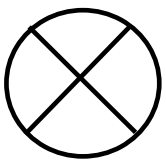

The winner is the one with the most pairs at the end.

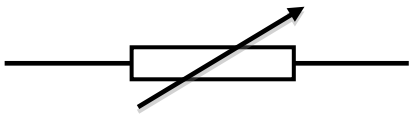

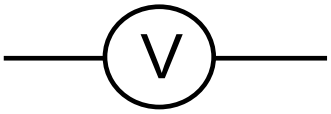

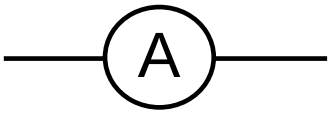

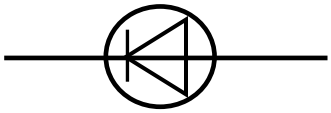

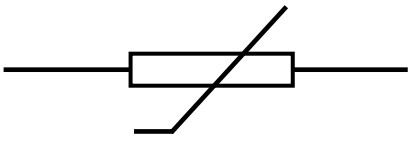

Variations

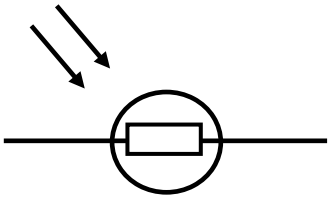

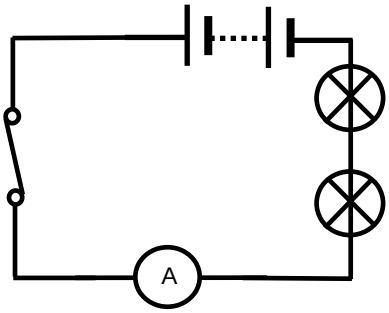

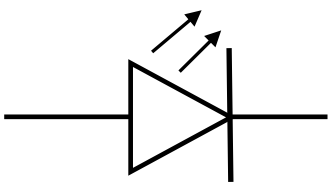

One player can be nominated in each group whose sole responsibility is to check the answers.

Groups of students can be formed according to their ability and different groupings of cards given to them. The less able may find that sheets one and two are enough to start with.

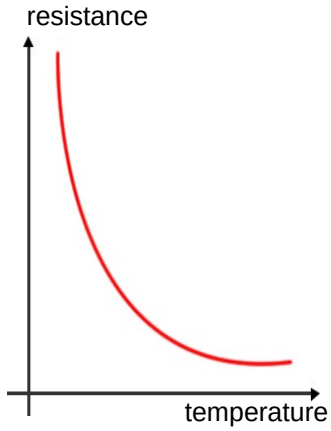

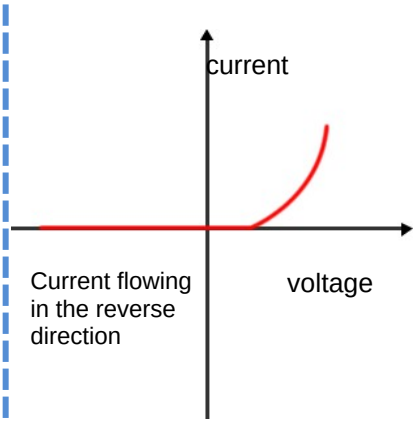

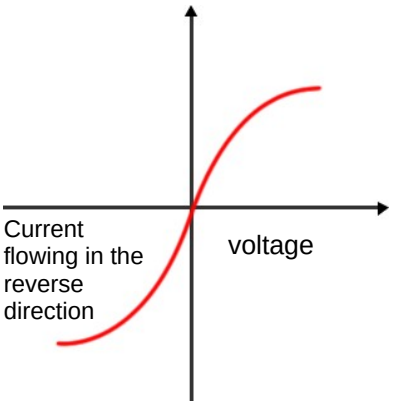

Also, with a bit of manipulation the names can be photocopied onto one colour of card and the symbol or graph onto another. Therefore, when a student picks up a pair of cards they are picking up two different colours. The game is faster this way.

cell	battery	switch (open)
		
closed switch	filament lamp	resistor
		

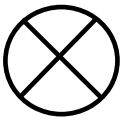

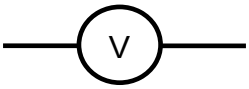

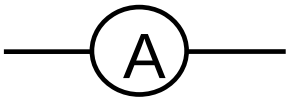

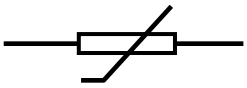

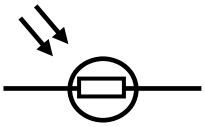

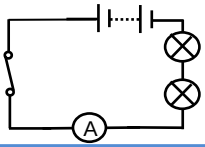

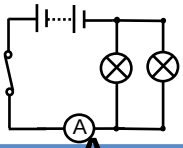

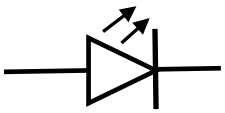

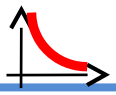

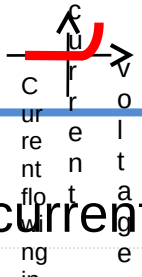

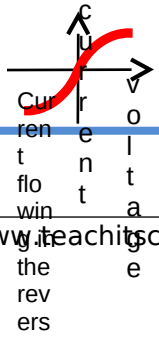

variable resistor	fuse	voltmeter
		
ammeter	diode	thermistor
		

LDR	DC	series circuit
	direct current	
parallel circuit	LED	AC
		alternating current

A

thermistor resistance/ temperature graph	diode current/ voltage graph	filament lamp current/voltage graph
		
ohms	volts	current
Ω	V	I

Answers
