To separate any mixture you need to identify the different physical properties of each part of a mixture and use a specific laboratory procedure that will enable separation.

Cut out the statements below and link each mixture to its physical properties and the laboratory procedure used to separate it.

Mixture	Physical properties	Laboratory procedure
stony soil	One part of the mixture is insoluble and will settle at the bottom of a container.	chromatography
ethanol (an alcohol) from a mixture of ethanol and water	Each part of the mixture has a different solubility.	sieving
salt solution	One part of the mixture is attracted to a magnet.	evaporation
the pigments in black ink	Each liquid in the mixture has a different boiling point.	distillation
sand and iron filings	One part of the mixture is a liquid and the other is an insoluble solid.	filtration
a suspension of chalk dust in water	This is a mixture of different sized particles.	magnetism
stones and water	One part of the mixture has a much lower boiling point.	decanting
