Task 1 - Complete the table below using diagram of the eye. Use the words in the box to help you, they can be used more than once.

Label no.	Part of the eye	Description	Function
1		Mucous ..... that covers the front of the eye and lines the inside of the eyelid.	Provides the eye with ..... so that it can open and close easily.
2		Front part of the sclera, tough, convex and	Bends the ..... as it enters the eye. It helps to protect the eye.
3	pupil	The opening in the middle of the eye that appears to be	Allows ..... to enter the eye and focus on the .....
4		Soft, flexible, transparent ..... disc.	Focuses light on the .....
5	iris	It is the ..... part of the eye.	Contains muscles that control the size of the pupil and therefore the amount of light that enters the eye.
6		A group of fibres that connects the lens to the ..... muscles.	Hold the ..... in place.
7		Circular ring of muscle surrounding the	It cause the ..... to change shape as it contracts and relaxes.
8		Tough, ... outer part of the eye that extends from cornea to the back of the eye.	Protects the eye from serious ..... and provides a good surface for the ..... that control eye movement to connect to.
9		A thin lining on the back of the eye.	Contains cells called rods and cones which are sensitive to ..... .
10		Clear ..... like substance located between the ..... and the lens.	Keeps the eye firm and gives it shape.

11		The area of the eye where the optic nerve and the ..... meet.	This part of the eye is not sensitive to ..... as it contains no rod or cone cells.
12		Group of ..... neurons at the back of the eye.	Sends visual information to the .....

membrane	**brain**	**moisture**	**sensory**	**black**	**damage**	**retina**	**bi-convex**
transparent	**gel**	**light**	**muscles**	**coloured**	**lens**	**ciliary**	**white**

Answer sheet

Label no.	Part of the eye	Description	Function
1	conjunctiva	Mucous membrane that covers the front of the eye and lines the inside of the eyelid.	Provides the eye with moisture so that it can open and close easily.
2	cornea	Front part of the sclera, tough, convex and transparent.	Bends the light as it enters the eye. It helps to protect the eye.
3	pupil	The opening in the middle of the eye that appears to be black.	Allows light to enter the eye and focus on the retina.
4	lens	Soft, flexible, transparent disc with a bi-convex shape.	Focuses light on the retina.
5	iris	It is the coloured part of the eye.	Contains muscles that control the size of the pupil and therefore the amount of light that enters the eye.
6	suspensory ligament	A group of fibres that connects the lens to the ciliary muscles.	Hold the lens in place.
7	ciliary muscle	Circular ring of muscle surrounding the lens.	It cause the lens to change shape as it contracts and relaxes.
8	sclera	Tough, white outer part of the eye that extends from cornea to the back of the eye.	Protects the eye from serious damage and provides a good surface for the muscles that control eye movement to connect to.
9	retina	A thin lining on the back of the eye.	Contains cells called cones and rods which are sensitive to light.
10	vitreous humor	Clear gel like substance located between the retina and the lens.	Keeps the eye firm and gives it shape.
11	blind spot	The area of the eye where the optic nerve and the retina meet.	This part of the eye is not sensitive to light as it contains no rod or cone cells.
12	optic nerve	Group of sensory neurons at the back of the eye.	Sends electrical impulses to the brain.
