Task

Cut up the table and match the organelles with the correct diagram and description.

Answers

cell wall vacuole		Helps plant cells keep their shape. Where proteins are synthesised (made).
cell membrane cell membrane		Controls what enters and leaves the cell. It contains genetic material, which controls the cell.
cytoplasm ribosomes		Jelly like substance and where most of the chemical reactions take place. Where energy for the cell is released by respiration.
nucleus cytoplasm		It contains genetic material, which controls the cell. Helps plant cells keep their shape.
vacuole nucleus		Fills with cell sap to keep plant cells shape. Where light energy is absorbed for photosynthesis to make food for plants.
mitochondria chloroplast		Where energy for the cell is released by respiration. Jelly like substance and where most of the chemical reactions take place.
chloroplast mitochondria		Where light energy is absorbed for photosynthesis to make food for plants. Controls what enters and leaves the cell.
ribosomes cell wall		Where proteins are synthesised (made). Fills with cell sap to keep plant cells shape.

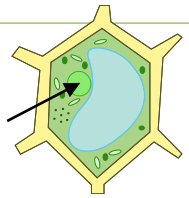

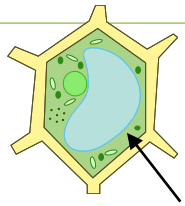

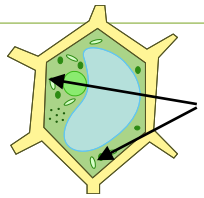

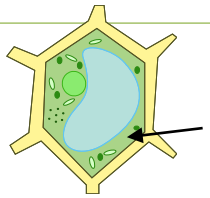

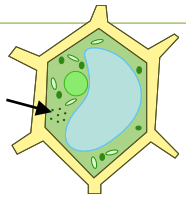

Teaching notes

The activity could be used in a variety of ways:

- individual card sort
- give each student a card and get them to find their two partners
- put students into groups of two or three. Give one student the picture cards and the answer sheet. They show the others a picture card. The pair should then name and describe the organelle indicated.

The activity could be differentiated by giving the students the answer table with some of the names and/or descriptions missing. The missing sections could be given to them on cards to fill in the table. For more able students simply give them the answer table with just one section filled in for each row.

Some of the organelles are common to both plant and animal cells, so the extra cards below could be introduced as well.

				
nucleus	cytoplasm	mitochondria	cell membrane	ribosomes
