Name:

DNA and Protein Structure

Pg 88 Pearson Science 10

All living cells use the same genetic code based on 4 nitrogenous bases _____, _____, _____ & _____. The bases are grouped into genes. Each gene codes for the same _____ acid in all organisms.

Even organisms that are very different such as _____ and _____ have large sections of _____ which are the same. An example is the gene for _____ _____.

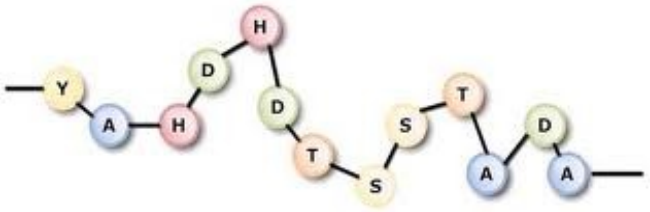

Organisms that seem to be similar using _____ _____ have more _____ in common than those that are less alike. For example humans and chimps have ___% of their DNA in common. This can be seen as evidence supporting evolution because

_____

_____

_____

Amino Acids in a chain

Proteins are made out of _____ _____ like a chain of beads. The order of the amino acids is controlled by _____. The more of the sequence two organisms have in common the more closely related they are. An example of where this is used to see how closely related two species are is

_____

_____

_____

_____

More than one protein needs to be studied before you can make reliable judgements about _____.
