Cornell notes Turner style
Instructions

- Cut out the notes on the right hand side and **paste** into the **right hand side** of your notebook page.
- **Include** the **vertical black line or redraw this line** – giving yourself a large left hand margin
- **Read** the notes several times
- **Ask** yourself **three questions**:
  1. Can I recognise all the content (information) in the notes?
  2. In the notes is there a process or procedure I need to know?
  3. Do I understand the idea/meaning/argument outlined in the notes. That is: do I "get it"?
- **Do the following**
  - **a.** Within the notes themselves, **underline** all the **content** you should learn or memorise.
  - **b.** In the left margin **label** each section of the notes as either a **definition**, **example**, **explanation**, **process**, or **evidence** (and you could make up your own categories)
  - **c.** With each label in step b, write a key word or phrase which tells us what the label is referring to. An example would be…

(note – the example is not for these notes
- The key words are highlighted)

  - **d.** At the end of the notes **write a summary underneath the notes**. The summary should be **short** – it is to **demonstrate your understanding** of the notes, not rehash the content. Often you should try to draw a diagram or mind map.

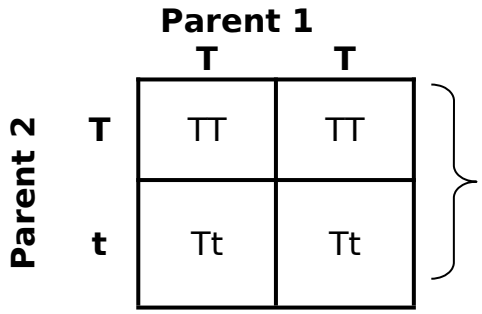

Monohybrid Crosses

The simplest example of genetics / heredity is the passing on of a trait caused by a single gene(like tongue rolling). That is, a trait for which a person can have two different alleles. This type of inheritance pattern can be predicted by a process called monohybrid crosses.

Monohybrid inheritance patterns use a punnet square to predict what the offspring of parents would be like:

e.g. 2 parents
- one is purebred tongue roller (TT)
- one is hybrid tongue roller (Tt)

- 100% offspring (progeny) are a tongue rolling phenotype.
- 50% are purebred dominant genotype
- 50% are hybrid genotype

- **<u>Dominant genes</u>** are ones that mask other characteristics. We show them with a capital letter.
- **<u>Recessive genes</u>** are masked by dominant ones. We show them by a lower case letter.
- **<u>Homozygous recessive</u>** = 2 lower case letter and displays recessive trait (bb).
- **<u>Homozygous dominant</u>** = 2 capital letters and displays dominant trait (BB)
- **<u>Heterozygous</u>** = 2 different letters and displays dominant trait (Bb)

`**Homo'** means same and `**hetero'** means different.
