Hormones

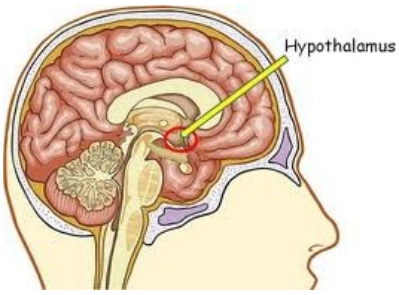

Name:_____

Using Chapter 7.2 Pearson Science 9

The hormonal system is called the _____ system. Hormones are _____ which act as _____ in the body. Organs that produce hormones are called _____ _____. There are many endocrine glands and together they form the _____ system. These glands are called endocrine glands because they release their hormones directly into the _____ not to the outside of the body as a salivary gland or sweat gland does. Endo means inside.

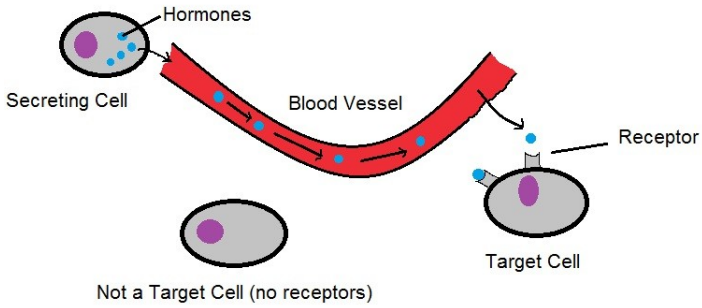

The_____ gland coordinates the endocrine system. The pituitary gland follows instructions from the _____.

The hypothalamus is very important because it links the _____ and _____ systems.

Target Cells

Hormones are _____, this means they only affect particular cells. They cells they affect are called _____ _____.

Each hormone has a different chemical structure which means it is a different shape. Target cells have specially shaped _____ on them. The hormone fits into its own target cells receptor like a jigsaw puzzle piece, no other hormones will fit.

Homeostasis

Homeostasis is the process of
_____
_____

Homeostasis requires receptors that
_____ and effectors that
_____.

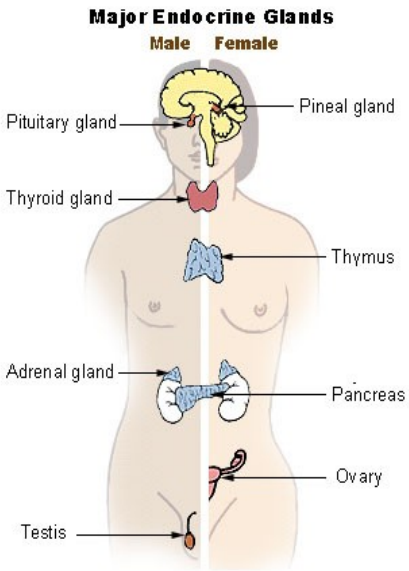

<u>How hormones help maintain Homeostasis</u>:

Use the following words (you may use them more than once): *endocrine, less, receptors, hypothalamus, hormone, hormones, homeostasis, pituitary gland, blood stream, target cells*

_____ monitors the body's internal environment via _____. If changes are required it sends _____ to the

_____ receives message from the hypothalamus and responds by releasing more or _____ of particular

Hormones from the pituitary gland travel around the body in the _____ _____ to other _____

Only the target gland is affected by each particular hormone. The amount of _____ it receives tells the endocrine gland to release more or less of its

Hormones from the endocrine glands only affect particular cells in the body called _____ _____

The target cells respond and the internal environment of the body is changed in an attempt to maintain
