Cell Division: Mitosis

Why do we produce new cells?

-
-
-

How do we produce new cells?

- The cell replicates its genetic material
- The nucleus divides into two
- The cell divides into two

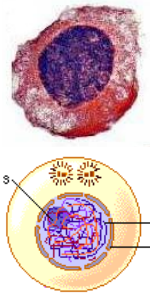

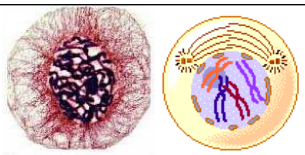

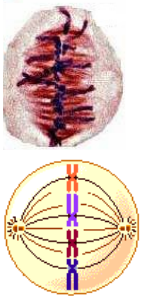

What is the definition of mitosis?

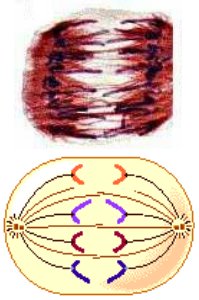

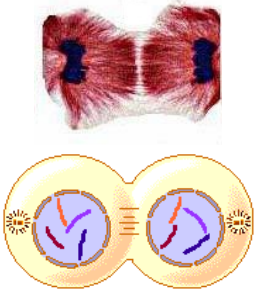

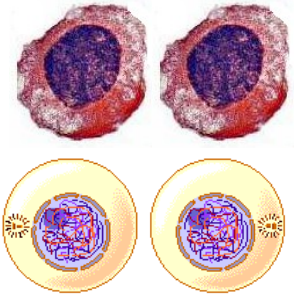

Mitosis is

_____

_____

What are the stages involved in mitosis?

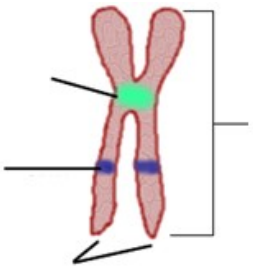

Phase of Mitosis	Description of Phase	Images of Phase
Interphase (before mitosis)		
Prophase		
Metaphase		

Anaphase		
Telophase		
Interphase (after mitosis)		

Below are descriptions of events that occur during mitosis. Identify the stage of mitosis by writing

- I for interphase
- P for prophase
- M for metaphase
- A for anaphase
- T for telophase

Structure of a Chromosome

____ The cell performs its normal functions

____ Spindle fibres attach to the centromere

____ DNA replication takes place

____ The nuclear membrane breaks down

____ The spindle forms

____ The daughter chromosomes reach opposite poles of the cell

____ New nuclear membranes form and the chromosomes start to unravel

____ The chromosomes line up onto the equator of the cell.

____ Daughter chromosomes are dragged to opposite ends of the cell

____ The cell pinches in the middle and starts to divide in two

____ The centromeres break, separating the chromosomes

____ The chromatin condenses into visible chromosomes
