Distance and Time Graphs

In a distance and time graph, time always goes on the horizontal axis.

The table below shows the distance covered by a person walking over 5 seconds. Graph the data in the table below. Have your distance axis go up to 30 m.

Time (seconds)	Distance (m)
1	2
2	4
3	6
4	8
5	10

The steeper the line of the slope(gradient) the faster the object is travelling.

Now draw the line for this person on a scooter onto the graph you drew earlier.

Time (seconds)	Distance (m)
1	5
2	10
3	15
4	20
5	25

What do you notice about the slope (gradient) of second line for the Scooter?

What does this tell you about the Scooter?
