DNA Bases

DNA is made up of a twisted double strand (double helix) of special chemicals called nitrogen bases. The sequence these bases come in stores genetic information.

Adenine bases (A) always join to _____( ) bases.

Thymine bases (T) always join to _____( ) bases.

Cytosine bases always join to _____( ) bases.

Guanine bases always join to _____ ( ) bases.

This is called complimentary base pairing.

Instructions.

LOOK AT SHEETS 2, 3 AND 4

a. Colour all of the Adenines(A) red.
b. Colour all of the thymines(T) blue.
c. Colour all of the cytosines(C) green.
d. Colour all of the Guanines(G)orange.
e. Cut out the Bases **on JUST sheet 2 and 3.**
f. Match the bases to the strand on sheet 4.
g. Glue them in place ON SHEET 4.
