Figure 4

DNA Bases

DNA is made up of a twisted double strand (double helix) of special chemicals called nitrogen bases. The sequence these bases come in stores genetic information, like an alphabet with only 4 letters.

Instructions.

a. Colour all of the adenines (A) red.
b. Colour all of the thymines (T) blue.
c. Colour all of the cytosines (C) green.
d. Colour all of the guanines (G)orange.
e. Cut out **JUST THE FIRST 4 nucleotides.**
f. Match the bases to second set of nucleotides.
g. Glue them in place.

A= _____ and always joins to _____( ) bases.

T = _____ and always joins to _____( ) bases.

C = _____ and always joins to _____( ) bases.

G = _____ and always joins to _____( ) bases.

This is called _____ base pairing.

Which molecule is the base always joined to?_____

What does P stand for? _____

The base, sugar and phosphate joined together is called a _____.
