Writing Equations

For each reaction below, write the word equation, then an equation with formulae.

Reaction	Hydrochloric acid is added to magnesium hydroxide, producing water and magnesium chloride.
Word Equation	
Formula Equation	

Reaction	Nitric acid is added to calcium carbonate, producing bubbles of carbon dioxide, water and calcium nitrate.
Word Equation	
Formula Equation	

Reaction	Sodium hydroxide is added to sulphuric acid, producing water and sodium sulphate.
Word Equation	
Formula Equation	

Reaction	Hydrochloric acid is poured over sodium carbonate. This produces carbon dioxide, water and sodium chloride.
Word Equation	
Formula Equation	

Reaction	Iron metal reacts with chlorine gas to produce iron III chloride.
Word Equation	
Formula Equation	

Reaction	Hydrogen gas reacts with oxygen gas to produce water.
Word Equation	
Formula Equation	

Reaction	Methane burns in oxygen to form carbon dioxide and water.
Word Equation	
Formula Equation	

Reaction	Aluminium metal reacts with oxygen to form aluminium oxide.
Word Equation	
Formula Equation	

Reaction	Hydrochloric acid is added to zinc producing zinc chloride and hydrogen.
Word Equation	
Formula Equation	

Reaction	Sodium carbonate decomposers into sodium oxide and carbon dioxide.
Word Equation	
Formula Equation	

Reaction	Lead reacts with oxygen to produce lead oxide.
Word Equation	
Formula	

Equation	
Reaction	Carbon burns in oxygen to form carbon dioxide.
Word Equation	
Formula Equation	

Reaction	Magnesium carbonate decomposes to magnesium oxide and carbon dioxide.
Word Equation	
Formula Equation	

Reaction	Calcium oxide reacts with hydrochloric acid to form calcium chloride and water.
Word Equation	
Formula Equation	

Reaction	Hydrochloric acid is poured onto magnesium carbonate. This produces magnesium chloride, carbon dioxide and water.
Word Equation	
Formula Equation	

Reaction	Sodium metal is burnt in oxygen. This forms sodium oxide.
Word Equation	
Formula Equation	

Reaction	Zinc oxide reacts with hydrogen sulphide to produce zinc sulphide and water.
Word Equation	
Formula Equation	

Reaction	Nitric acid is added to potassium metal. This produces potassium nitrate and hydrogen gas.
Word Equation	
Formula Equation	

Reaction	Hydrochloric acid is added to potassium oxide producing potassium chloride and water.
Word Equation	
Formula Equation	

Reaction	Copper II carbonate is reacted with hydrochloric acid. This produces copper II chloride, carbon dioxide and water.
Word Equation	
Formula Equation	

Reaction	Copper II hydroxide reacts with phosphoric acid producing copper II phosphate and water.
Word Equation	
Formula Equation
