CALCULATING THE AVERAGE ACCELERATION

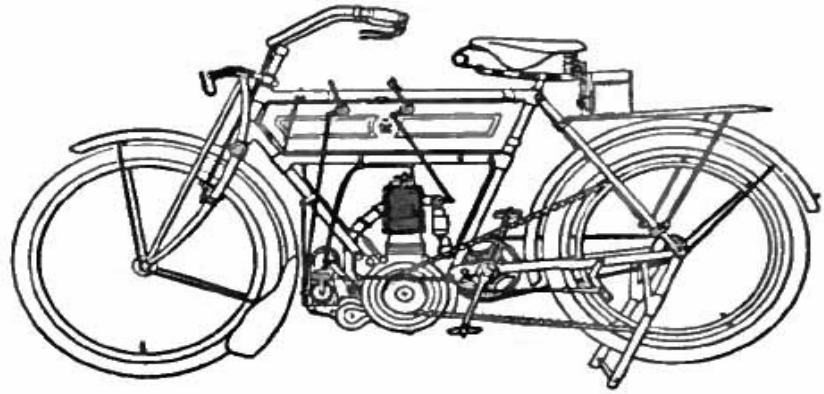

$$a = \frac{v-u}{t}$$

a=the average acceleration.

V=final speed

U=starting speed

t=time

Bill's motor bike can accelerate from 0kph to 100kph in 10 second. What is his average acceleration?

$$a = \frac{v-u}{t}$$

$$a = \frac{100 - 0}{10}$$

a= 10Km/h/s

So every second his motor bike gets 10km/h faster.

Car	Final speed	Starting speed	Calculation $a = \frac{v-u}{}$	Average acceleratio

	(t)	(u)	t	n (a)
