Describing chemical Reactions Using Equations

1) a) In your own words, define what is meant by a chemical reaction

_____

_____

_____

b) Define reactant

_____

_____

_____

c) Define Product

_____

_____

2) Identify all the reactants and products involved in the following chemical reactions.

a) A piece of magnesium metal was added to a solution of hydrochloric acid, resulting in the formation of magnesium chloride solution and hydrogen gas.
Reactants:

_____

Products:

_____

b) Calcium carbonate powder was added to a solution of sulphuric acid, resulting in the formation of calcium sulphate. Water and carbon dioxide gas were also produced.
Reactants:

_____

Products:

_____

c) Solid lead chloride precipitate was formed when solutions of chloride and lead nitrate were mixed. Sodium nitrate solution was also produced.
Reactants:

_____

Products:

_____

d) Iron oxide is separated into iron and oxygen.
Reactants:

_____

Products:

_____

e) When ethanol is burned it forms carbon dioxide and water.
Reactants:

_____

Products:
