Classifying Acid Reactions (p77-79)

There are many types of chemical reactions. Each type of chemical reaction has something in common. This could be common reactants or products or the way the chemical reaction takes place.

Acids and Metal Reactions

1. Describe what acids can do to metals.

2. Give an example of this type of reaction.

3. Write the general equation for an acid/metal reaction.

4. Write word equations for two examples of acid/metal reactions.

5. Describe how the word salt is used in this context.

Neutralisation Reactions

1. Describe what a neutralisation reaction is.

2. Write the general equation for a neutralisation reaction.

3. Write word equations for two examples of neutralisation reactions.

4. Describe how antacids work to relieve heartburn. (Hint: look at the SciFile)

Acid and Carbonate Reactions

1. What are the products of a reaction between a carbonate and an acid?

2. Write the general equation for an acid/carbonate reaction.

3. Write a word equation to describe the reaction between calcium carbonate in chalk and hydrochloric acid?

Science as a Human Endeavour: Acid Rain (p80-81)

1. Explain why rain water is naturally acidic. Include a word equation in your answer.

2. Name two chemicals the burning of fossil fuels release into the atmosphere.

3. What are the acids that these chemicals form when they combine with water in the atmosphere?

4. Describe three effects acid rain can have on the environment.
   -
   -
   -

5. Give two ways that acid rain can be controlled.
   -
   -
