Charged Particles Name _____

1. Match up terms with definitions by writing the correct letter of each definition in the box beside each term.

Definition

a. Flow of electrons around a conducting pathway
b. Particles with equal positive and negative charges
c. Either solid, liquid or gas
d. Electrons in a metal which are able to move
e. Central area of atom containing protons and electrons
f. Negatively charged particles which orbit the nucleus
g. Objects which allow electrons to travel through
h. Form of energy which can travel along conductors
i. Object which has a deficiency of electrons
j. Needed to do or change things
k. Objects which do not allow electrons to travel through
l. Positively charged particles found in the nucleus
m. The build-up of electrical charge on an insulator
n. Object which has gained extra electrons
o. Complete conducting loop
p. Extremely small particles that all matter is made of
q. Simple way of drawing electrical circuits
r. Neutral particles found in the nucleus
s. Particles found in the nucleus

Terms

	Attempt	
	1st	2nd
Electricity		
Energy		
Static electricity		
Current electricity		
Charged particles		
Matter		
Atoms		
Electrons		
Neutrons		
Protons		
Nucleus		
Electrically neutral		
Conductors		
Insulators		
Negatively charged		
Positively charged		
Circuit		
Free electrons		
Circuit diagram		

2. Draw symbols for these circuit components.

Lamp	Power pack	Resistor	Ammeter	Voltmeter

3. Complete the sentences.

a. Like charges _____

b. Unlike charges _____
