
plants open their pores for carbon dioxide and lose water to evaporation (**transpiration**)
water vapor cools and changes back into liquid form (**condensation**)
water, driven by the heat of the sun, changes into vapor and rises into the air (**evaporation**)
rain and snow (**precipitation**) onto land
evaporation from the land and ocean
rain and snow (**precipitation**) into the ocean
surface runoff
the ocean
underground water filters down (filtration) and moves toward the ocean
The Water Cycle

Word	Meaning
Evaporation	Heat from the _____ changes liquid _____ into a g_____
Transpiration	Water e_____ from plants through tiny p_____ on their leaves.
Precipitation	Water falls as r_____ or s_____.
Condensation	Water v_____ cools and changes back to _____ form.
Percolation	The slow filtering of water through the soil.

State three ways that water gets into the ocean.

What is the process that forms clouds?

What do we call the type of evaporation that happens through the pores of plants?
