Cornell notes Turner style
Instructions

- Cut out the notes on the right hand side and **paste** into the **right hand side** of your notebook page.
- **Include** the **vertical black line or redraw this line** – giving yourself a large left hand margin
- **Read** the notes several times
- **Ask** yourself **three questions**:
  1. Can I recognise all the content (information) in the notes?
  2. In the notes is there a process or procedure I need to know?
  3. Do I understand the idea/meaning/argument outlined in the notes. That is: do I "get it"?
- **Do the following**
  - **a.** Within the notes themselves, **underline** all the **content** you should learn or memorise.
  - **b.** In the left margin **label** each section of the notes as either a **definition**, **example**, **explanation**, **process**, or **evidence** (and you could make up your own categories)
  - **c.** With each label in step b, write a key word or phrase which tells us what the label is referring to. An example would be…

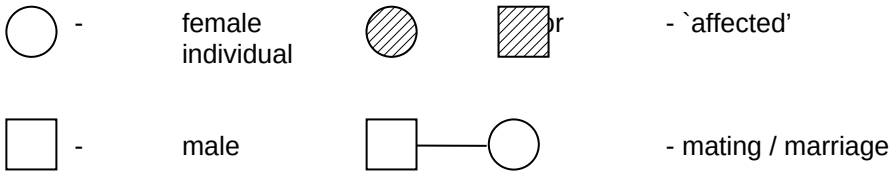

(note – the example is not for these notes
- The key words are highlighted)

  - **d.** At the end of the notes **write a summary underneath the notes**. The summary should be **short** – it is to **demonstrate your understanding** of the notes, not rehash the content. Often you should try to draw a diagram or mind map.

Pedigrees

Pedigrees show the appearance of a phenotype through several generations of a family. In doing so, Pedigrees `map' the pattern of a trait through a family. Pedigrees are an investigative tool of geneticists. The pedigrees allow us to determine if a trait is caused by a dominant or recessive allele or if it is autosomal or allosomal.

Symbols used in pedigrees:

Two parents – Dad has the disease
Three children – 2 boys, 1 girl, one boy has the disease
