Electric Shock Comprehension
Answers

1 The coma position involves the victim lying on their side with the leg closest to the ground fully extended and the other leg bent at the knee. The arms are stretched in front of the victim.

2 A current of 50 mA needs to flow for about 4 000 m s. This is about 4 seconds.

3 Th three factors are: voltage, the path taken and the skin resistance of the victim.

4 The first thing you should do is remove the source of the electricity from the victim. Use an insulator to separate the victim from the source.

5 The body of the car will probably be a conductor. If the wires are in contact with the car , the car will be “live” and will conduct a current to all of its surface.

6 You should reassure the victim, treat burns and send for medical assistance.

7 You should position the person in the coma position, open the mouth and clear any obstruction.

8 If the current flows across the chest it will effect the heart and may cause the heart to fibrillate.
