Name: _____

Evidence for Evolution

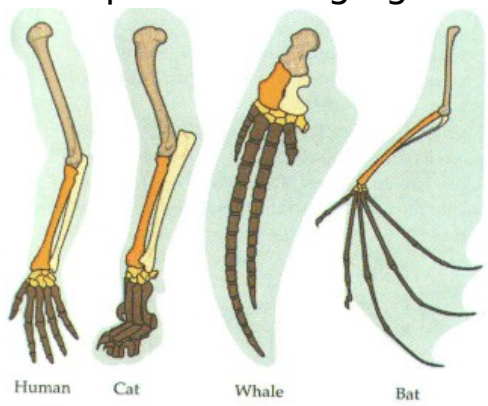

1._____

Very old fossils are _____, newer fossils are _____. This supports the idea of evolution because_____
_____
_____

The number of _____ that live on earth has also increased with time. Another word for the number of species is _____. This supports evolution because_____

_____
_____

_____ are fossils that show species that seem to be a mix of an older and a new species. This suggests one species changing into another.

2._____

The compares the _____ of organisms of both living and _____. Homologous structures fit into this category. These suggest a common _____

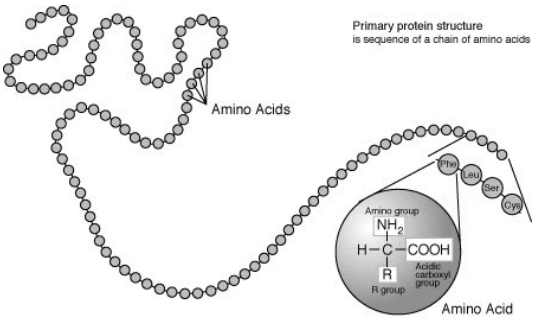

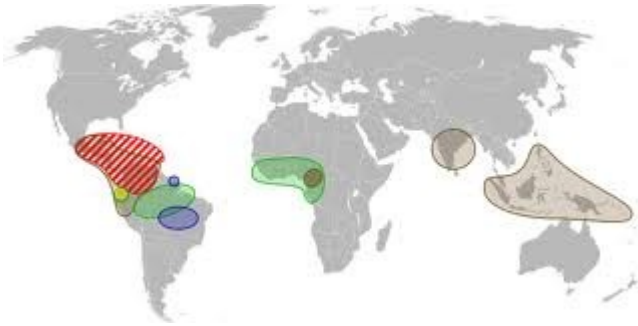

3._____

All living cells have the same basic _____ structure.

4._____

All species use the same _____ _____ to make proteins. Species that are more closely related have a more similar _____ than species that are less closely related.

5._____

Distribution is

_____
_____

Many _____ (not found anywhere else) species are found on isolated islands. With evolution you would expect this because _____ is needed before _____ can occur.

6._____

This is the study of

_____
_____.

All vertebrates are very similar when in the _____ stage. The similarities include

_____

_____

_____.

The study of embryology supports the idea that species were formed from pre-existing species eg _____ evolved into_____ which evolved into _____.
