DESIGN A THERMOS FLASK
HOW HOT WILL IT STAY?

Your task is to design, build and test a thermos flask using the following equipment and using the minimum materials possible.

2 X 100 ml glass beaker
250 ml glass beaker
2 X thermometers
stopwatch
boiling water
clingfilm (gladwrap)
aluminium foil
cotton wool

Take care with hot glass!!!

You will be awarded marks for the following:

1. Your design (a cross section sketch with labels)
2. Your experimental method (how did you test it: a diagram would be useful)
3. Your results: a table and graph would show clearly what happened.
4. Your conclusions: how well did your design work compared to a normal beaker of the same size.
5. Improvements that you think may be possible to your design or your experiment.

REMEMBER: you must repeat this experiment with a control comparison (in other words “do the same thing” with a beaker that is **NOT** insulated to compare it to your new design).

Marks:	Design	5 marks
	Method	5 marks
	Results	5 marks
	ConclusionExplanation	5 marks
	Improvements	5 marks
	TOTAL	25 marks
