Your speed

Your teacher has measured a distance out on the ground.

What is the distance?

What did he use to measure it?

Have a friend use a stop watch to measure how fast can you run this distance?

Now complete this table

Distance (m)	Time (seconds)	Speed (m/s) $V = \frac{d}{t}$	Convert this to speed in km/h To do this multiply your speed in m/s by 3.6

Calculating the Distance

In a previous lesson we worked out the speed from the distance and time using this equation.

$V = \frac{d}{t}$

If you know the speed and time you can work out the distance travelled by rearranging the equation.

d =v x t

eg

Bob travels for 2 hours at 110km/h. How far has he travelled?

d = v x t

110 X 2

d = 210 km

Jenny travels for 3 hours at 55 km/h. How far did she travel?

New words

Words	Meaning
Instantaneous speed	The speed at a particular instant in time
Velocity	The speed of something in a given direction.

Complete this table

Situation	Average speed, or instantaneous speed or velocity.
I looked at my cars speedometer, it said 50KpH	
The average speed of the plane flying East towards Sydney was 700KPH.	
At the moment of impact the ball was moving at 20M/S
