Classify the statements as belonging to either mitosis or meiosis.

Halves the number of chromosomes in cells

Important for the repair of damaged tissue where new cells must be identical to the damaged cells

The parent cell becomes two daughter cells

Produces new genetic combinations in individuals

The daughter cells contain half the number of chromosomes as the parent cell

Four daughter cells are produced

Daughter cells have the same number of chromosomes as the parent cell

The daughter cells are exact copies of the parent cell

Happens only in gamete producing organs (testes, ovaries, pollen sacs, ovules)

Important for the growth of plants and animals

Forms gametes (sex cells)

Ensures the number of chromosomes stays the same in sexually reproducing organisms

Crossing over occurs, increasing the variety in offspring

Exact copy of parent cell DNA is found in the daughter cells
