

TYPES OF GALAXIES

Early in the history of the universe, matter (mostly the light atoms hydrogen and helium) clumped together by gravitational attraction to form countless trillions of stars. Billions of galaxies (approx 50,000 billion) now form most of the visible mass in the universe. A galaxy is a collection of stars, interstellar medium such as dust and gas and a substance called dark matter. There are several different types of galaxies within our universe, the most common types are listed below. Your job is to complete the following table using books and the internet to help you.

TYPE OF GALAXY	DESCRIPTION	EXAMPLES
Spiral		
Barred Spiral		
Elliptical		
Irregular
