Bonding

A bond is force which holds particles together in molecules.

There a number of different types of bond. We call these bonding types:

-Ionic bonding
-Metallic bonding
-Covalent bonding

Ionic bonding

Here charged particles are held together due to their difference in charge.

Positive ions are attracted to negative ions.

Ionic boning=where ions are bonded together due to difference in charge.

Table salt is sodium chloride

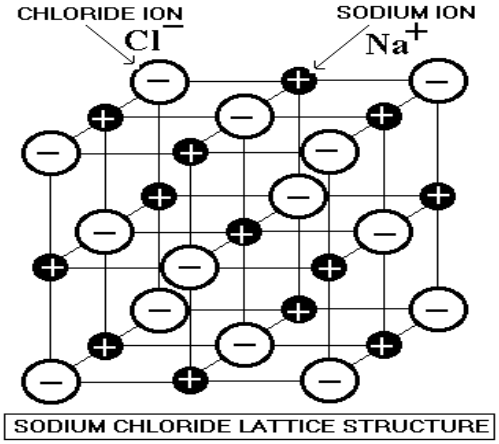
Na^+ bonds to Cl^-

This gives the compound molecule

NaCl

Properties of ionic compounds

1. **Ionic compounds form crystals. We call this structure a crystal lattice**



SODIUM CHLORIDE LATTICE STRUCTURE

2. **Ionic compounds have high melting points and high boiling points.**
3. **Ionic compounds are hard and brittle.**
4. **Ionic compounds conduct electricity when they are dissolved in water.**
