Carbon Cycle Activity

Imagine you are a carbon atom and are moving through the carbon cycle. For each move you take, you will roll a dice to determine where you will go.

Use the table below to record your movements. You should say where you started, where you have ended up, and how you got there. In the how I got there column you should name of the process that moved the carbon.

Where I started	Where I moved to	How I got there

1. How many times did you visit the atmosphere?

2. How many different routes did you take to get there?

3. Most of the carbon in an organism goes towards respiration. What is respiration?

4. What happens to the carbon atoms during respiration?

5. How does carbon go from a rabbit to a fox?

6. How is carbon released from dead organisms?

7. What is released when fossil fuels are burned?
