ACIDS AND METALS

Equipment:

Bench mat
zinc, Safety glasses
8 small test tubes
Test tube rack
Samples of 4 metals (iron, copper, magnesium)
Dropper bottles of:
hydrochloric acid and sulfuric acid

Method:

1. Place a small amount of each of the metals into a test tube.
2. Add approximately 1ml acid
3. Record any observations in the table below.
4. repeat with the other acid.

Metal	Acid	Observation

Studying the data:

1. Which metals were found to react with acids?
2. Look at the periodic table and;
   name another metal that will not react with acids

   name another metal that will react with acids.

   name any two metals that are too dangerous to react with acids.

3. What was the gas being produced?

4. How could you test for this gas? Carry out a test to confirm that you are correct. (use larger test tubes for this test)

Summary:

A word equation for this reaction is:

ACID + METAL ⟶ **_____ + _____**
(gas)

(For experts) Work out the salt produced in each of the reactions.
