Common Indicators.

Name:_____

Aim:_____

_____

_____

_____

Equipment: 0.1 M solutions of-: Sodium Hydroxide ( )
Hydrochloric Acid ( )
Distilled Water, 3 test tubes, Test tube rack, 3x 100ml beakers, liquid red and blue litmus, universal indicator, methyl orange, methyl red, bromothymol blue, phenolphthalein, safety glasses.

Procedure:

1. Collect equipment required.
2. Using the beakers pour 2cm of acid into one test tube, 2cm of sodium hydroxide (base) into another test tube, and 2cm of distilled water into a third test tube.
3. Add three drops of litmus red into each test tube. Record your results on the table provided.
4. Repeat steps two and three for the other indicators.
5. Answer focus questions.

Indicator	Colour in Strong Acid	Colour in Strong Base	Colour in Neutral Solution (water)
Red Litmus			
Blue Litmus			
Universal Indicator			
Methyl Orange			
Methyl Red			
Phenolphthalein			

Focus Questions:

Why was distilled water used and not regular tap water?

Summarise your results in the space provided below.

In what field of science, meaning what occupation, could these indicators be used in the world outside the laboratory?

What is pH and which indicator do you think would be the best for measuring it?
