Lenses and what they do.

Name:_____

Convex Lens.

1. Look through a convex lens and, with the aid of a diagram describe the difference made to your normal vision in the space below. (Give a detailed answer)

2. Put two convex lenses together and describe the changes.

3. Predict what would happen when three convex lenses were put together.

4. Put three convex lenses together. Was your prediction correct? Explain.

Concave Lens.

1. Look through a concave lens and, with the aid of a diagram, describe the difference made to your normal vision in the space below. (Give a detailed answer)

2. Put two concave lenses together and describe the changes.

3. Predict what would happen when three concave lenses were put together.

4. Put three convex lenses together. Was your prediction correct? Explain.

Telescopes.

1. What lenses do you think would be needed to make a telescope?

2. Using the lenses provided determine the orientation and lenses required to make a telescope.

3. Draw a detailed diagram of your telescope in the space below.

4. Using you knowledge and notes on how convex and concave lenses bend light waves, draw a diagram making an inference on how a telescope bends light to make objects look closer.
