Distance and Displacement

When we travel from one place to another we need to think about the Displacement and the Distance.

The **displacement** is the **straight- line** distance between where you start and where you finish.

The **distance** is the **total** length travelled by an object between the starting point and the finish point.

So in this diagram the bike rides from tree A to house B to tree C.

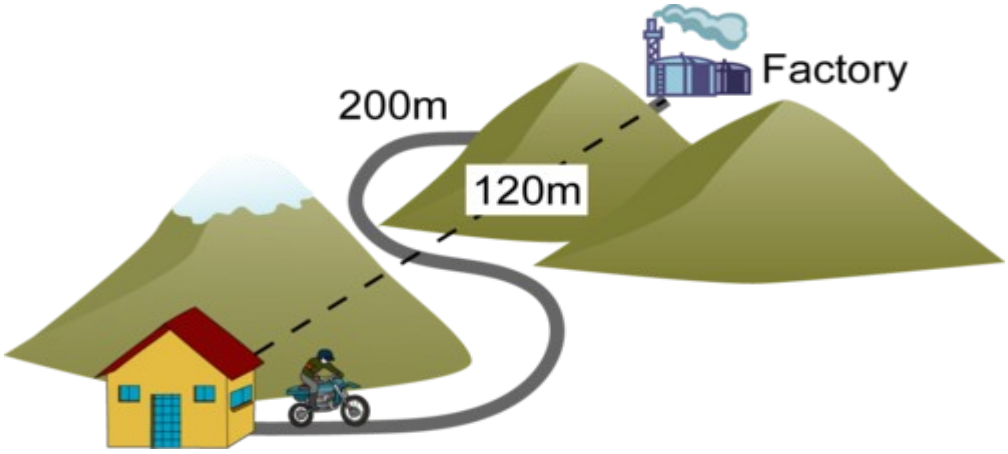

The **distance** it travelled was 7m (4m+3m).

Its **displacement** is 5m. Point A to C.

1. In the diagram below state the motor bikes:

Displacement=_____

Total distance travelled=_____

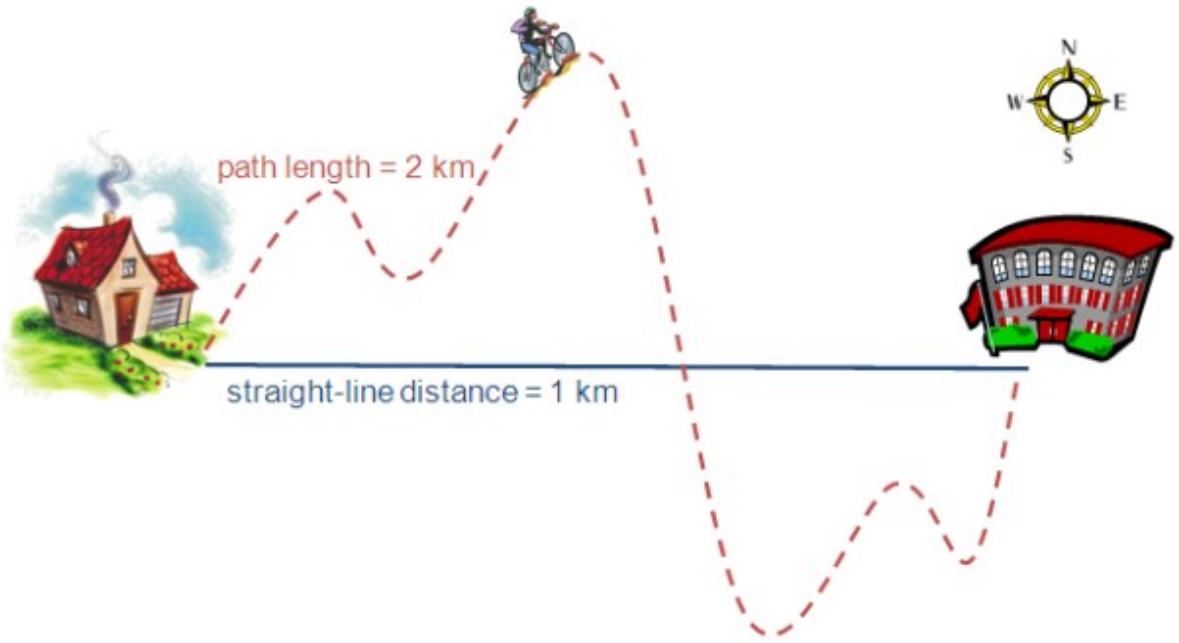

2.

2. In the diagram below state the bikes:

Displacement=_____

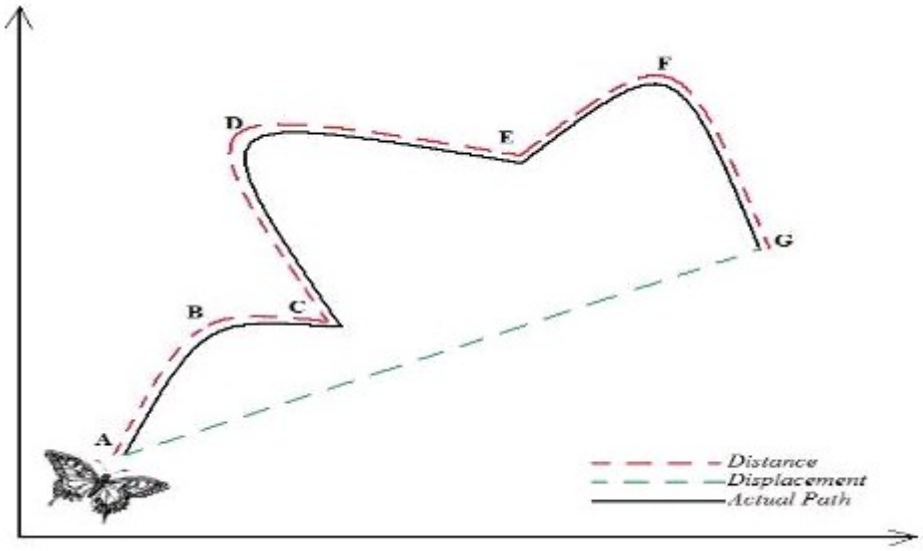

Total distance travelled=_____

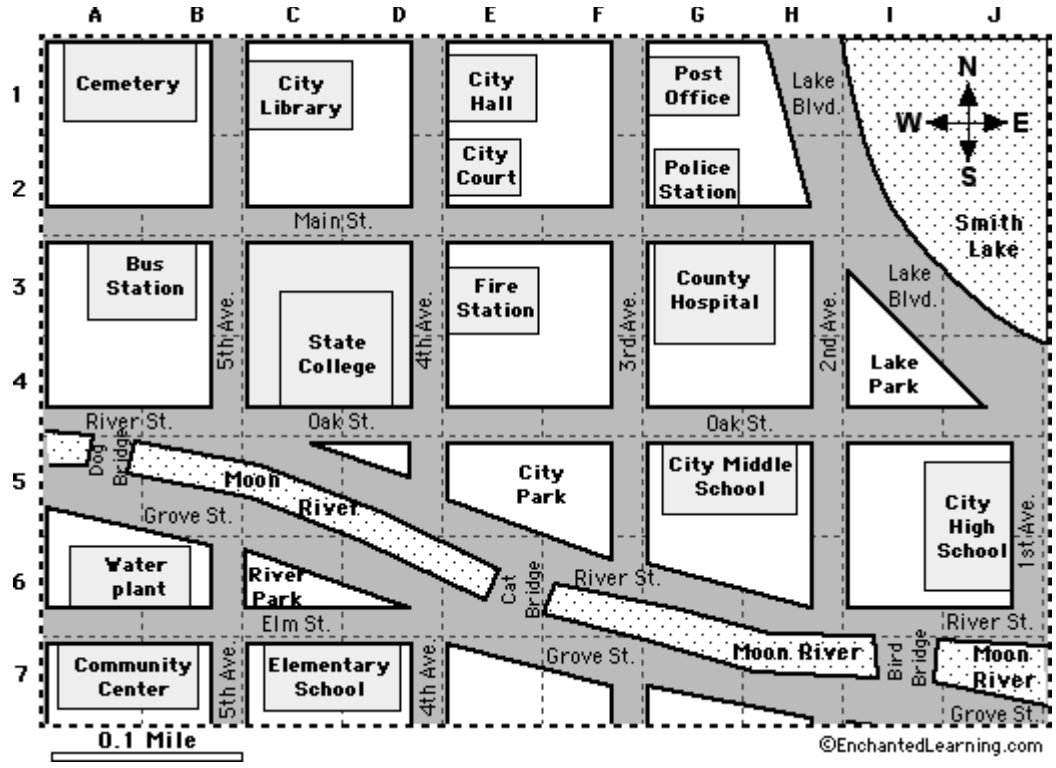

3. Use a ruler to measure the displacement and string to measure the distance.

Displacement=_____

Total distance travelled=_____

4.

In the diagram above 1cm =1km

Start point	Finish point	Distance (km)	Displacemant (km)
A	B		
A	C		
B	D		
A	D
