Life and Living: Understand your own biology and that of other living things and recognise the interdependence of life.

Interrelationships Level Outcomes

Level 2:Describe the types of relationships between living things.

Few organisms live alone. They live together with members of their own species and with members of other species, often interacting with them. For example, animals may eat animals of other species, animals may compete for resources, some species, such as plants, help other species by providing food, shelter and shade.

Describe the following relationships between living things.

(a) Bees and flowers

_____

_____

_____

_____

(b) A leaf and a caterpillar

_____

_____

_____

_____

(c) A flea and a dog

_____

_____

_____

_____

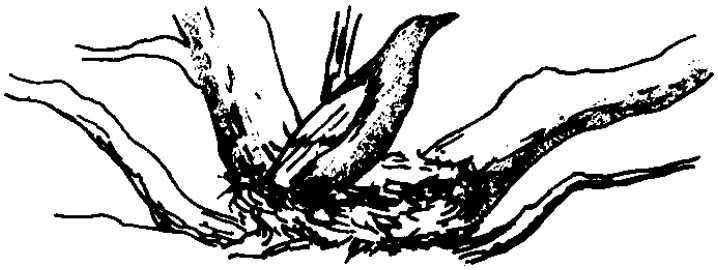

(d) A fungus and a rotting log

(e) An eagle and a rabbit

(f) Rabbits and sheep in a paddock

(g) Birds and trees

(h) Trees and grass growing in a field

- **Groups of organisms of different species living together in a place and interacting are called communities.**

Types of relationships

Many relationships between living things involve one organism eating or decomposing another. Other types of relationships also exist. They may be beneficial, harmful or neutral.

Find out about the following types of relationships.

1. Consumer - producer

_____

_____

_____

_____

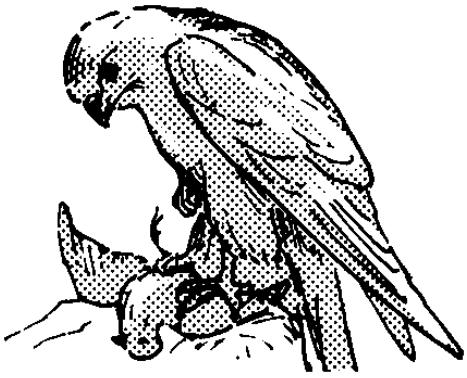

2. Predator – prey

_____

_____

_____

_____

3. Decomposers

4. Competition

5. Parasite – host

6. Commensalism

_____

_____

_____

_____

7. Mutualism

_____

_____

_____

_____
