Unknown Solutions

A solution is made by adding a chemical to water and allowing the chemical to dissolve. In this experiment you will be identifying five unknown solutions, using the Key given below.

For each experiment, add about a 1 cm depth of the unknown solution to a clean test tube and then add the chemical named in the key.

KEY - Identification of Solutions

1.	Is colourless ……..	go to 2.
	Is blue ……	**copper sulfate solution**
2.	Turns pink when mixed with a few drops of phenolphthalein ……	go to 3.
	Stays colourless when mixed with a few drops of phenolphthalein …	go to 4.
3.	Fizzes when 1 cm depth of hydrochloric acid added ……	**sodium carbonate solution**
	Does not fizz when hydrochloric acid added ……	**sodium hydroxide solution**
4.	Goes yellow when lead nitrate solution added ……..	**potassium iodide solution**
	Goes white when lead nitrate solution added ……	**sodium chloride solution**

Results

Unknown A _____

Unknown B _____

Unknown C _____

Unknown D _____

Unknown E _____
