Classifying

Biologists are able to group similar animals together by studying the structures and functions of animals and looking for common features. When a biologist collects all the information about the structure and function of a specific animal or a new animal, then it can be identified and grouped with other animals of the same type.

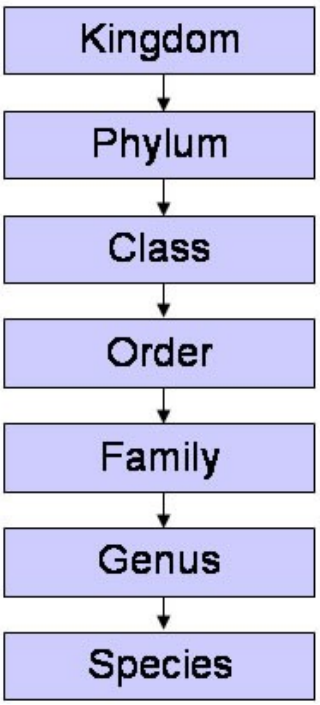

Scientists have observed over a million different types or species of living things which can be called animals. These can be as different as a jellyfish and a snail, or a mosquito and an elephant.

Highlight the following words and find the meaning.

1. Similar _____
2. Structure _____
3. Function _____
4. Common _____
5. Specific _____
6. Observed _____

After something is classified into a kingdom it is separated into different groups depending on its structure and function. The groups go as follows:

Linnaeus's System of Classification

Remember
Humans

_____
_____

_____
_____

_____
_____

_____
_____

_____ _____

_____ _____

_____ _____ Animals are in the Kingdom Animalia, Phylum Chordata and Sub-Phylum Vertebrata.

Vertebrata has 5 classes in it:

Group		Example	Body Covering
Mammals			
Reptiles			
Birds			
Amphibians			
Fish	Bony		
	Cartilaginous		

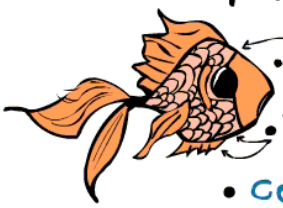

.

FISH

- breathe underwater using gills.
- have scales and fins.
- Cold-blooded.
- lay eggs.
