Speed and velocity

Student: ..... Class: .....

Calculating average speed

1. The average speed (v) for a journey is calculated using the formula:

$$v = \frac{d}{t}$$

where d = distance travelled and t = time taken.

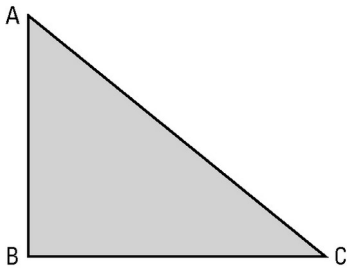

Complete the following table. Make sure you include the appropriate units for each quantity.

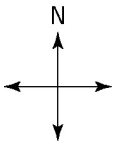

Distance travelled	Time taken	Average speed
100 m	20 s	
3 km		60 km/h
	15 s	20 m/s
2 km		25 m/s

Average speed and average velocity

2. Two vehicles (X and Y) travel from A to C along different paths as shown in the diagram (not drawn to scale). X travels along the path ABC and vehicle Y travels along AC. The triangle ABC is a right-angled triangle. A is north of B.

AB = 600 m
BC = 800 m

Both vehicles take 70 s for the trip.
Perform the necessary calculations to complete the following table.

Average speed of X	Average velocity of X	Average speed of Y	Average velocity of Y
